

## CLEANING DILUTION CHART

To Determine How Much Concentration Cleaner to Use...

1. Use one of the tables below and find the size of your cleaning tank.
2. Select a concentration of cleaner that works for your application (a solution of 1-2% cleaner in water is a recommended starting point).
3. Find the cell where the column of cleaner concentration intersects with the row of the tank size
4. Add this volume of cleaner to your tank.
5. Then, slowly add water until your tank is full.

Note that adding water to the solution too quickly may cause some cleaners to foam. To avoid this, pour the water first, then add the cleaning solution.
